DESQO® DSQ200 Operator Station

SOS DESQO® TELEPHONY PLATFORM

DESQO® is a VoIP platform designed to create professional emergency telephony systems for roads, highways, railways, tunnels, subways, public areas, industrial environments.

The platform is entirely based on free and internationally widespread protocols, so it can accept virtually any kind of telephone equipment that meets international standards.

POSTO OPERATORE DESQO®

DSQ-200 is the VoIP Operator Station of the **DESQO®** emergency telephone network. It can be powered via PoE or 12Vdc.

Equipped with a **large color graphic display**, it allows the operator an immediate view of traffic even when multiple SOS emergency calls are in progress at the same time.

On the right side there are 24 keys with LEDs usually used to allow direct calling of system users. In this case the LED of each button indicates the out of service status of the associated telephone.

For small systems (<24 SOS) this section offers a complete view of the status of the SOS phones.

For systems with a large number of SOS stations greater than 24, it is possible to use the optional graphic maps of the DESQO® system that allow you to view the status of the entire SOS telephone network on a screen.

REDUNDANCY of the OPERATOR STATION

The **DESQO®** platform allows you to install two operator stations in **PRIMARY** and **SECONDARY** configuration in order to ensure the forwarding of calls in the event of unavailability for technical or operational reasons of one of the two stations.

TECHNICAL FEATURES

- Conversation with handset
- Hands-free conversation
- Volume adjustment
- Headphone input with microphone
- Configurable via browser
- PoE or 12Vdc power supply
- Bracket for possible wall mounting included
